EnKrypto Labs.

EnKrypto is a local trust verification SDK that continuously monitors datasources, generates cryptographic integrity proofs, and detects tampering using deterministic hashing pipelines.

```
# WHY USE THE ENKRYPTO SDK?

The SDK acts as a local runtime layer.
It observes changes, fingerprints data states,
and produces verifiable proof chains on-device,
eliminating the need for third-party trust servers.
```

Installing and Running EnKrypto

```
# 1. Install via pip
~ % pip install enkrypto

# 2. Verify engine installation
~ % enk

EnKrypto CLI initialized.
Type 'help' for available commands.
```

Step 1: Install EnKrypto SDK

```
</>  >> pip install enkrypto
```

Step 2: Initialize EnKrypto SDK

```
</>  >> enk
```

NOTE: Python must be added to PATH

CLI COMMANDS

```
~ % enk --help

USAGE:
  enk [COMMAND] [PATH]

COMMANDS:
  connect    Registers a target datasource to the runtime
  track      Starts live continuous integrity monitoring
  status     Checks if a specific source is actively
monitored
  stop       Halts the active tracking runtime for a source
  list       Displays all connected sources in the local
registry
  exit       Terminates the CLI session
```

SUPPORTED FORMATS

```
~ % enk system --formats

INTEGRITY ENGINE SUPPORTS:

  > .JSON       (Nested objects & arrays)
  > .CSV        (Tabular flat structures)
  > .XLSX       (Excel workbooks and sheets)
  > MONGODB     (NoSQL Document databases)
  > SQL         (Relational Database tables)

Adapter modules for these formats are pre-compiled
and included globally in the base SDK installation.
```

EXAMPLE SCENARIO

```
# THIS IS AN EXAMPLE WORKFLOW SCENARIO

# Launch the EnKrypto CLI
~ % enk

# Connect the target financial ledger
enk> connect "/var/data/ledger.json"
[OK] Datasource registered and metadata stored.

# Initialize the monitoring daemon
enk> track "/var/data/ledger.json"
[OK] Watcher thread spawned. Monitoring live.

# Query the live status
enk> status "/var/data/ledger.json"
[ACTIVE] Current Canonical Hash: 9f4a12bc...

# Halt the monitoring session safely
enk> stop "/var/data/ledger.json"
[OK] Watcher thread terminated.
```
